

Emissions Monitoring Solutions for Emerging Markets

Mike Neyman
Ohio Lumex

The global trend of regulating emissions continues at full speed with more and more countries implementing emissions control and monitoring requirements. Emissions of interest include SO_x, NO_x, CO, CO₂, and Hg, among others. This presentation will review traditional approaches to emissions measurements in the US and Europe and discuss the challenges these approaches pose for emerging markets where local expertise and resources are still developing. The second part of the presentation will discuss alternative measurement solutions that are more conducive to these markets due to their lower cost, simplicity, and ability to measure all required pollutants in one instrument. Information will also be presented about current applications of these solutions at several Vietnamese plants.
